ICIDS 2024 - Theme Introduction

Infrastructure connects people to opportunities, promotes economic growth and improves quality of life. It also provides a pathway for countries to integrate their climate agenda by investing in projects that reduce carbon footprints. The leaders representing the World Economic Forum (2020) are extensively discussing the importance of building an economically, socially and environmentally sustainable world. Yet, across much of the developing world, infrastructure remains inadequate. Thus, closing the growth loops and designing new pathways to ensure a sustainable and equitable future for all becomes a shared responsibility.

The global focus on climate change and main streaming of sustainable development goals (SDGs) have led policy makers around the world to grapple with the need for more resources to steer the global economy on to a more sustainable developmental aspirations of each nation. Globally, countries are also embracing the emergence of digital ecosystems and green finance to support the development process. The emerging trends in the world of infrastructure are that of sustainable, equitable, digital, and green finance.
